

Timers

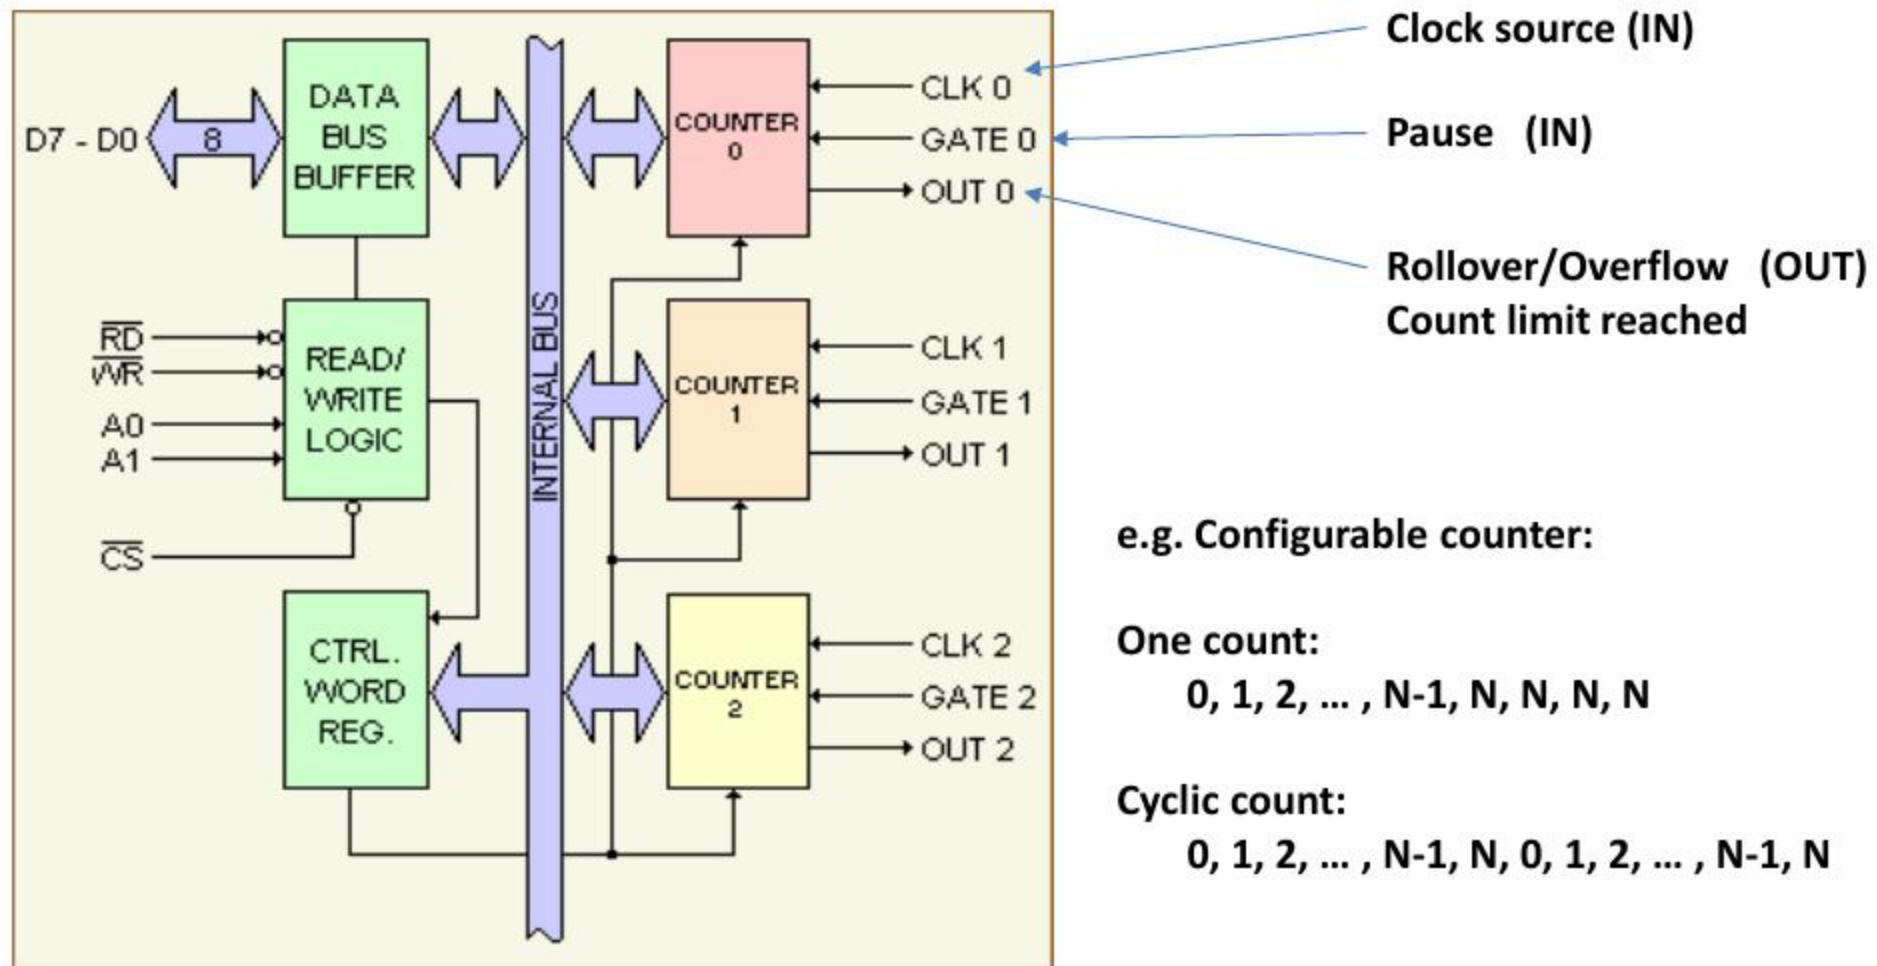

CCP Module

Dpt. Enginyeria de Sistemes, Automàtica i Informàtica Industrial

Introduction

- **Time** is represented by the count in a timer.
- There are many applications that cannot be implemented without a timer:
 1. Event arrival time recording and comparison
 2. Periodic interrupt generation
 3. Pulse width and period measurement
 4. Frequency and duty cycle measurement
 5. Generation of waveforms with certain frequency and duty cycle
 6. Time references
 7. Event counting
 8. Others

Generic Timers

The PIC18 Timer System

- A PIC18F45K22 microcontroller has up to 7 timers: Timer 0...Timer 6.
- Timer 0, Timer 1, Timer 3 and Timer 5 are 16-bit timers whereas Timer 2, Timer 4 and Timer 6 are 8-bit.
- When a timer rolls over, an interrupt may be generated if it is enabled.
- Timer 2, Timer 4 and Timer 6 use instruction cycle clock as the clock source whereas the other timers may also use external clock input as the clock source.
- Timer 0 is designed to act as a time base (core interrupt) while the other timers are in the peripheral group (alternate time base and CCP operation).

The PIC18 Timer0

- Can be configured as 8-bit or 16-bit
- Is a timer/counter depending upon the clock source.
- An interrupt may be requested when Timer0 rolls over from 0xFFFF to 0x0000.
- Operation is controlled by the T0CON register.

values
after Reset

T0CON Register

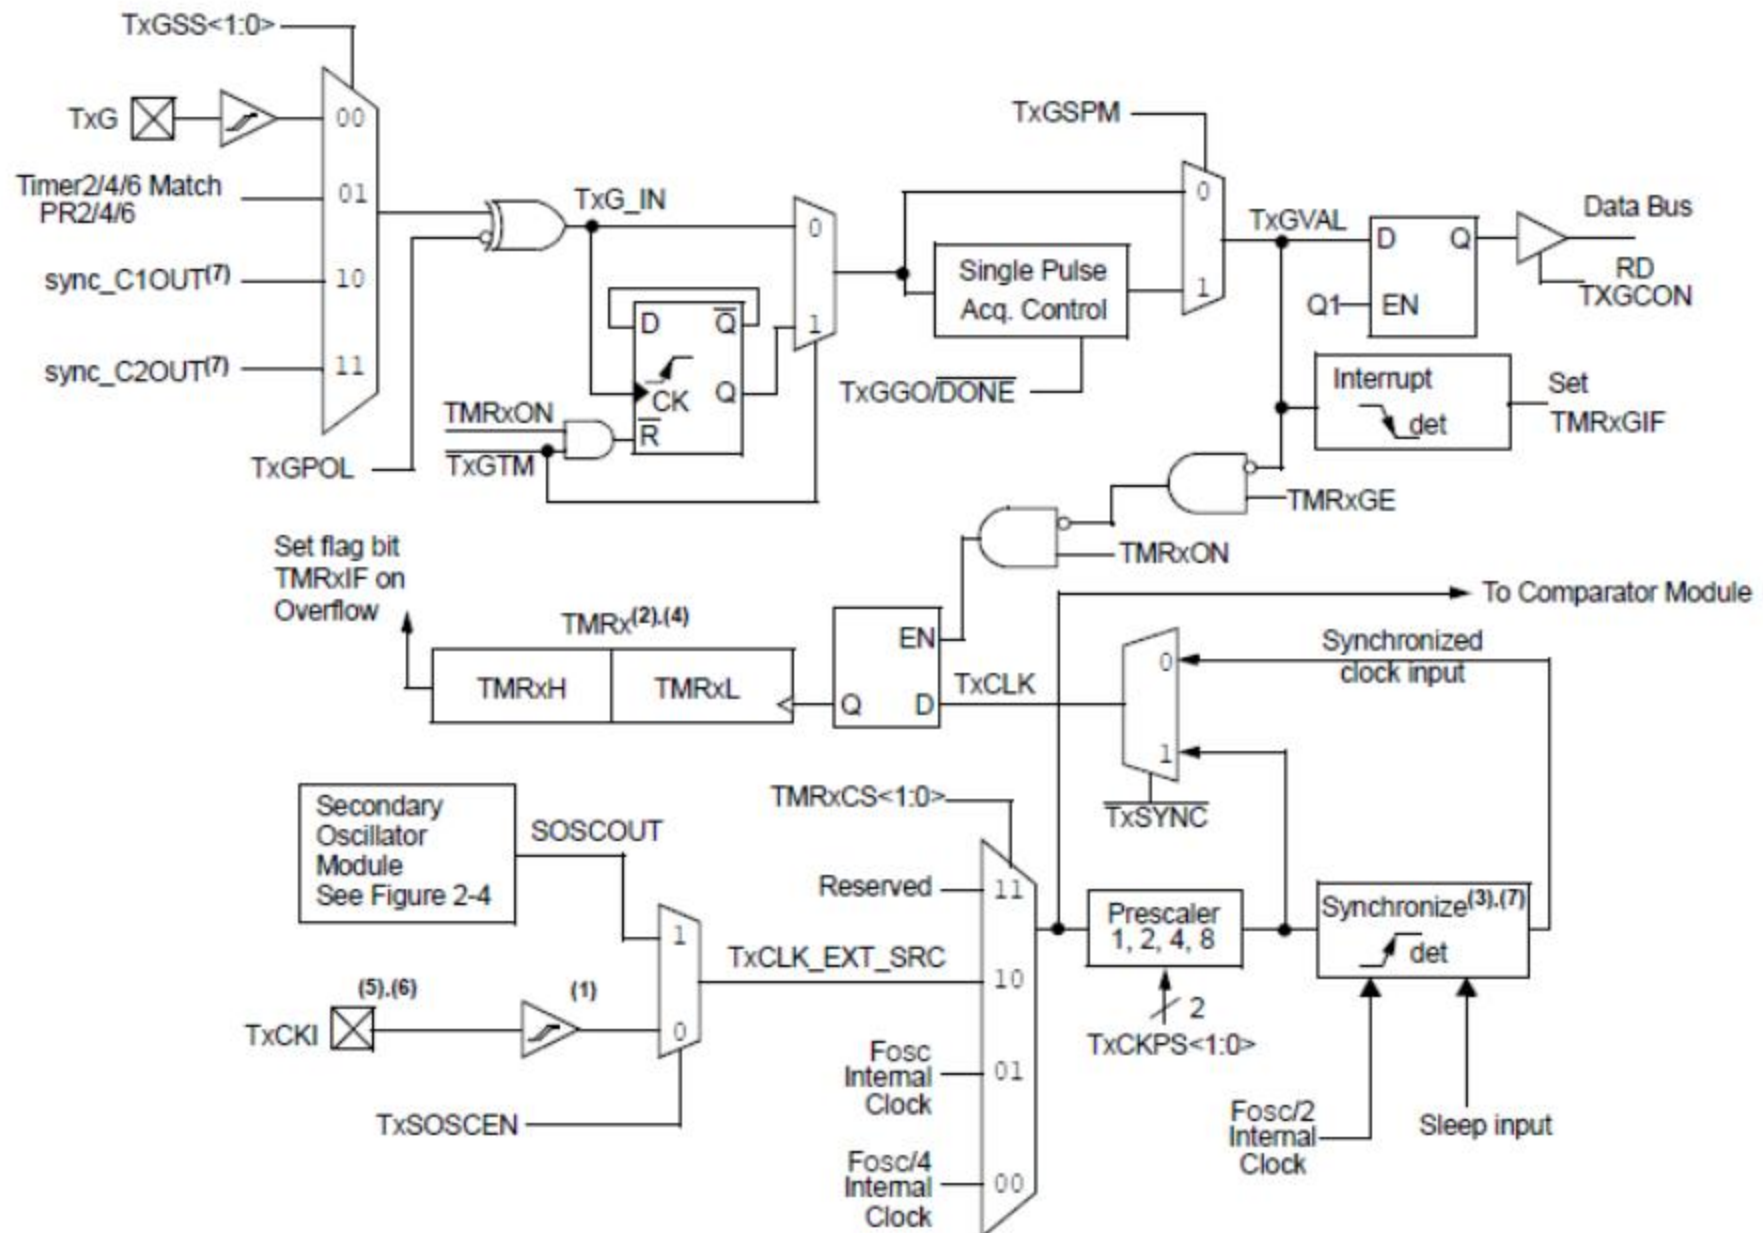

→ R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1
TMR0ON	T08BIT	T0CS	T0SE	PSA	TOPS<2:0>		
bit 7							bit 0

- bit 7 **TMR0ON:** Timer0 On/Off Control bit
 1 = Enables Timer0
 0 = Stops Timer0
- bit 6 **T08BIT:** Timer0 8-bit/16-bit Control bit
 1 = Timer0 is configured as an 8-bit timer/counter
 0 = Timer0 is configured as a 16-bit timer/counter
- bit 5 **T0CS:** Timer0 Clock Source Select bit
 1 = Transition on T0CKI pin
 0 = Internal instruction cycle clock (CLKOUT)
- bit 4 **T0SE:** Timer0 Source Edge Select bit
 1 = Increment on high-to-low transition on T0CKI pin
 0 = Increment on low-to-high transition on T0CKI pin
- bit 3 **PSA:** Timer0 Prescaler Assignment bit
 1 = Timer0 prescaler is NOT assigned. Timer0 clock input bypasses prescaler.
 0 = Timer0 prescaler is assigned. Timer0 clock input comes from prescaler output.
- bit 2-0 **T0PS<2:0>:** Timer0 Prescaler Select bits
 111 = 1:256 prescale value
 110 = 1:128 prescale value
 101 = 1:64 prescale value
 100 = 1:32 prescale value
 011 = 1:16 prescale value
 010 = 1:8 prescale value
 001 = 1:4 prescale value
 000 = 1:2 prescale value

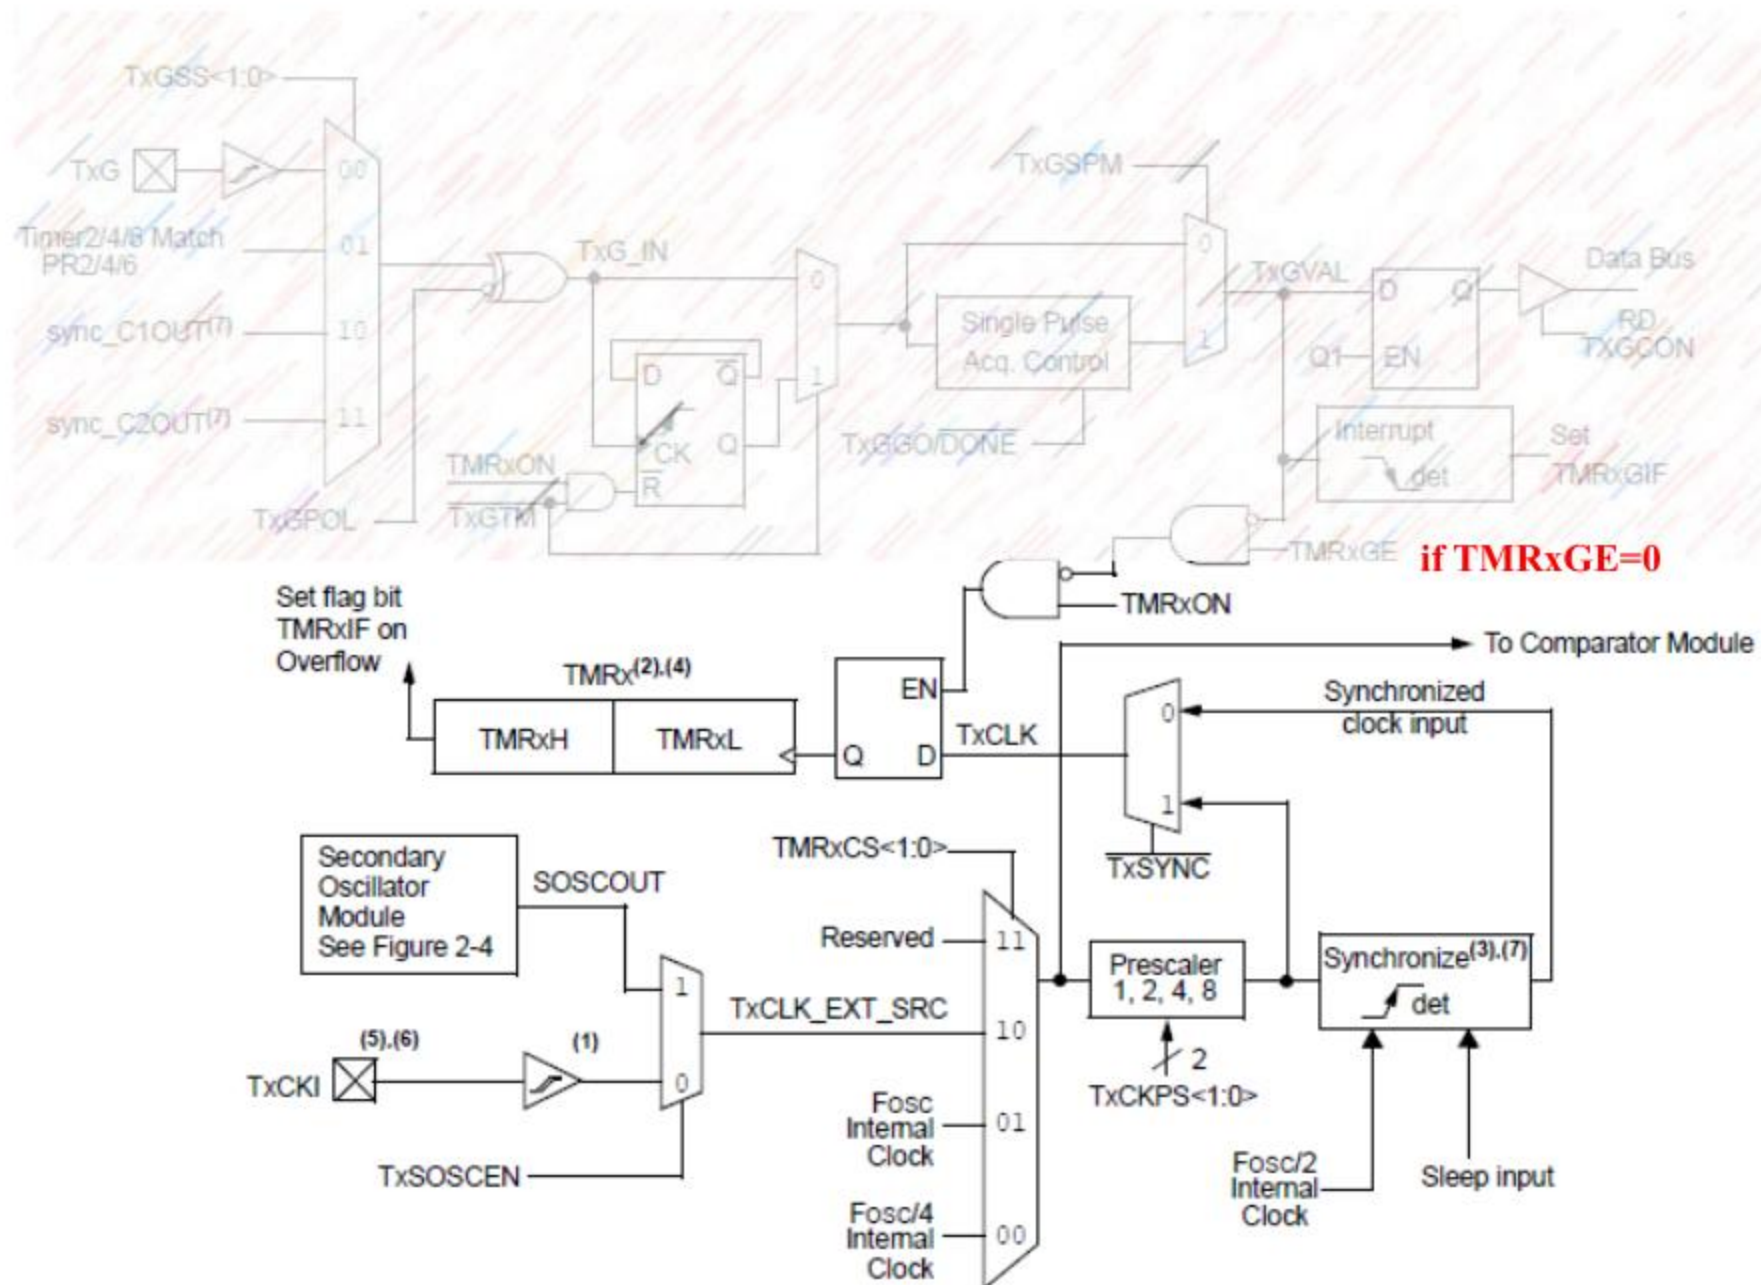

The PIC18 Timer1/3/5

- Is a 16-bit timer/counter depending upon the clock source.
- An interrupt may be requested when TimerX rolls over from 0xFFFF to 0x0000.
- TimerX operation is controlled by the TxCON and TxGCON register.
- These timers have a number of frequency input sources and a complex gate enable circuitry (if TMRxGE=1)
- These timers can be used to create time delays and measure the frequency of an unknown signal (using the CCP modules).

The PIC18 Timer1/3/5

The PIC18 Timer1/3/5

TxCON Register (x=1/3/5)

R/W-0/u	R/W-0/u	R/W-0/u	R/W-0/u	R/W-0/u	R/W-0/u	R/W-0/0	R/W-0/u
TMRxCS<1:0>		TxCKPS<1:0>		TxSOSCEN	$\overline{\text{TxSYNC}}$	TxRD16	TMRxON
bit 7							bit 0

- bit 7-6 **TMRxCS<1:0>**: Timer1/3/5 Clock Source Select bits
 11 = Reserved. Do not use.
 10 = Timer1/3/5 clock source is pin or oscillator:
 If TxSOSCEN = 0:
 External clock from TxCKI pin (on the rising edge)
 If TxSOSCEN = 1:
 Crystal oscillator on SOSC1/SOSCO pins
 01 = Timer1/3/5 clock source is system clock (FOSC)
 00 = Timer1/3/5 clock source is instruction clock (FOSC/4)
- bit 5-4 **TxCKPS<1:0>**: Timer1/3/5 Input Clock Prescale Select bits
 11 = 1:8 Prescale value
 10 = 1:4 Prescale value
 01 = 1:2 Prescale value
 00 = 1:1 Prescale value
- bit 3 **TxSOSCEN**: Secondary Oscillator Enable Control bit
 1 = Dedicated Secondary oscillator circuit enabled
 0 = Dedicated Secondary oscillator circuit disabled
- bit 2 **TxSYNC**: Timer1/3/5 External Clock Input Synchronization Control bit
TMRxCS<1:0> = 1X
 1 = Do not synchronize external clock input
 0 = Synchronize external clock input with system clock (FOSC)

TMRxCS<1:0> = 0X
 This bit is ignored. Timer1/3/5 uses the internal clock when TMRxCS<1:0> = 1X.
- bit 1 **TxRD16**: 16-Bit Read/Write Mode Enable bit
 1 = Enables register read/write of Timer1/3/5 in one 16-bit operation
 0 = Enables register read/write of Timer1/3/5 in two 8-bit operation
- bit 0 **TMRxON**: Timer1/3/5 On bit
 1 = Enables Timer1/3/5
 0 = Stops Timer1/3/5
 Clears Timer1/3/5 Gate flip-flop

TxGCON Register (x=1/3/5)

REGISTER 12-2: TXGCON: TIMER1/3/5 GATE CONTROL REGISTER

R/W-0/u	R/W-0/u	R/W-0/u	R/W-0/u	R/W/HC-0/u	R-x/x	R/W-0/u	R/W-0/u
TMRxGE	TxGPOL	TxGTM	TxGSPM	TxGGO/DONE	TxGVAL	TxGSS<1:0>	
bit 7							bit 0

Legend:

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

u = Bit is unchanged

x = Bit is unknown

-n/n = Value at POR and BOR/Value at all other Resets

'1' = Bit is set

'0' = Bit is cleared

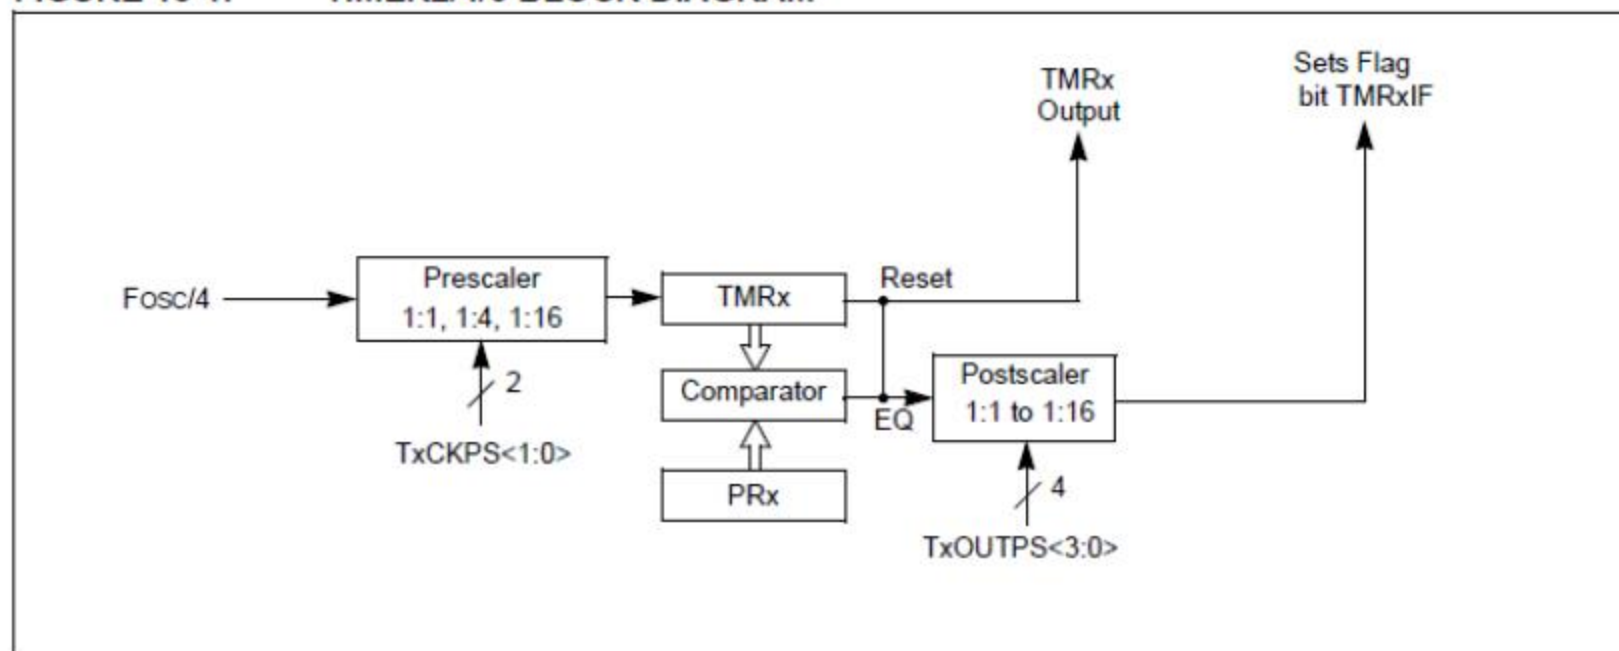

HC = Bit is cleared by hardware

- bit 7 **TMRxGE:** Timer1/3/5 Gate Enable bit  **TMRxGE=0 !!!**
If TMRxON = 0:
 This bit is ignored
If TMRxON = 1:
 1 = Timer1/3/5 counting is controlled by the Timer1/3/5 gate function
 0 = Timer1/3/5 counts regardless of Timer1/3/5 gate function
- bit 6 **TxGPOL:** Timer1/3/5 Gate Polarity bit
 1 = Timer1/3/5 gate is active-high (Timer1/3/5 counts when gate is high)
 0 = Timer1/3/5 gate is active-low (Timer1/3/5 counts when gate is low)
- bit 5 **TxGTM:** Timer1/3/5 Gate Toggle Mode bit
 1 = Timer1/3/5 Gate Toggle mode is enabled
 0 = Timer1/3/5 Gate Toggle mode is disabled and toggle flip-flop is cleared
 Timer1/3/5 gate flip-flop toggles on every rising edge.
- bit 4 **TxGSPM:** Timer1/3/5 Gate Single-Pulse Mode bit
 1 = Timer1/3/5 gate Single-Pulse mode is enabled and is controlling Timer1/3/5 gate
 0 = Timer1/3/5 gate Single-Pulse mode is disabled
- bit 3 **TxGGO/DONE:** Timer1/3/5 Gate Single-Pulse Acquisition Status bit
 1 = Timer1/3/5 gate single-pulse acquisition is ready, waiting for an edge
 0 = Timer1/3/5 gate single-pulse acquisition has completed or has not been started
 This bit is automatically cleared when TxGSPM is cleared.
- bit 2 **TxGVAL:** Timer1/3/5 Gate Current State bit
 Indicates the current state of the Timer1/3/5 gate that could be provided to TMRxH:TMRxL.
 Unaffected by Timer1/3/5 Gate Enable (TMRxGE).
- bit 1-0 **TxGSS<1:0>:** Timer1/3/5 Gate Source Select bits
 00 = Timer1/3/5 Gate pin
 01 = Timer2/4/6 Match PR2/4/6 output (See Table 12-5 for proper timer match selection)
 10 = Comparator 1 optionally synchronized output (sync_C1OUT)
 11 = Comparator 2 optionally synchronized output (sync_C2OUT)

The PIC18 Timer2/4/6

- There are three 8-bit timers with instruction clock source F_{cy} ($F_{osc}/4$) and prescaler and postscaler block logic.
- Controlled by TxCON and related to PRx registers.
- An interrupt may be requested when Timer value matches PRx
- They can be a source for PWM signals (CCP modules).

- 00 = Prescaler is 1
 - 01 = Prescaler is 4
 - 1x = Prescaler is 16

The PIC18 CCP units

- A PIC18 device may have one, two, or **five (K22)** CCP modules.
- CCP stands for **Capture, Compare, and Pulse Width Modulation**.
- Each CCP module can be configured to perform capture, compare, or PWM function.
- In **capture** operation, the CCP module copy the contents of a 16 bit timer into a capture register on a signal edge.
- In **compare** operation, the CCP module compares the contents of a CCPR register with that of a Timer (1, 3 or 5) in every clock cycle. When these two registers are equal, the associated pin may be pulled to high, or low, or toggled.
- In **PWM** mode, the CCP module can be configured to generate a waveform with certain frequency and duty cycle. Timers 2/4/6 are related with the PWM hardware.

Capture/Compare/PWM (CCP) Modules

- PIC18F45K22 has 5 CCP Modules.
- Each CCP module requires the use of timer resource.
- In capture or compare mode, the CCP module may use either Timer1, Timer3 or Timer5 to operate.
- In PWM mode, either Timer2, Timer4 or Timer6 may be used.
- The operation of a CCP module is controlled by the CCPxCON register (to select the mode), the CCPTMRS0 and CCPTMRS1 registers (to select the operating timer) and the 16-bits data register CCPRx (CCPRxH and CCPRxL).
- A device pin (CCPx pin) can be associated to CCP module operation (with appropriate TRIS configuration).

Capture Function

Capture Function

Gives a reference on the instant in which the event takes place
(Application: measure the period of a given signal)

Capture Mode

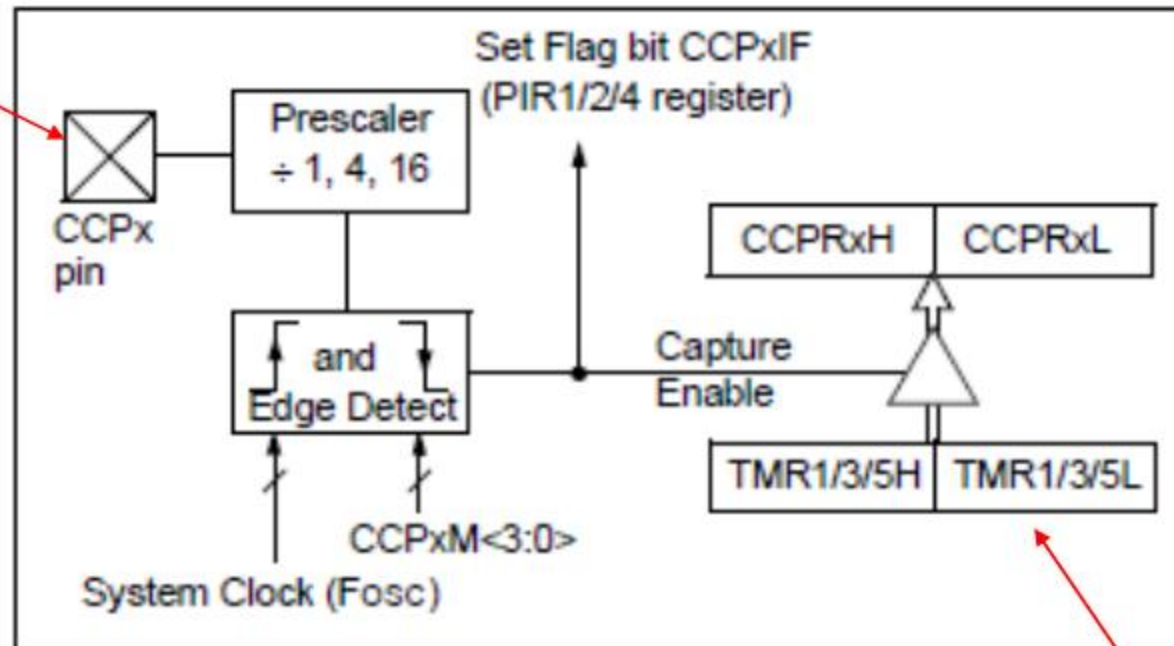

- Main use of CCP is to capture **event** arrival time
- An event is represented by a signal edge.

The PIC18 event can be one of the following:

1. every falling edge
2. every rising edge
3. every 4th rising edge
4. every 16th rising edge

Capture Unit

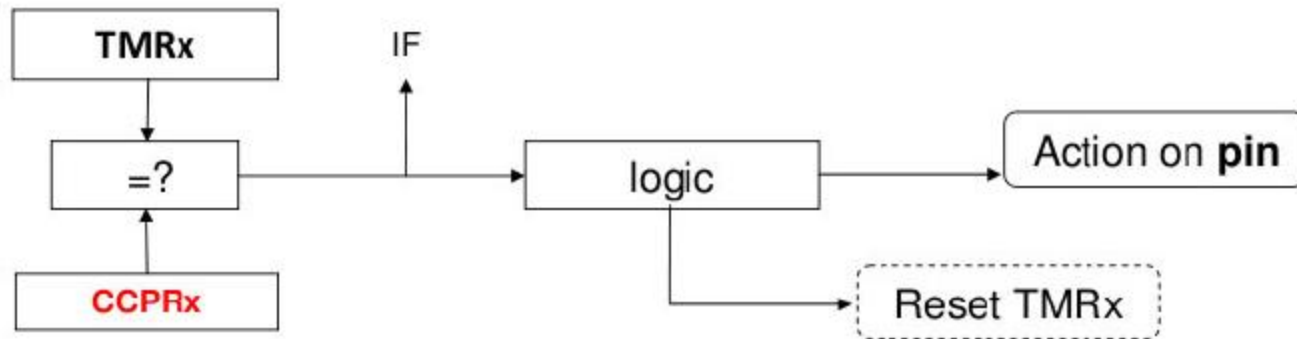

FIGURE 14-1: CAPTURE MODE OPERATION BLOCK DIAGRAM

The five capture units operate independently

Compare Function

Compare Function

Generates equally spaced time intervals
(Application: Delays, Pulse Trains)

Compare Mode

- 16-bit CCPRx register is compared against one of the Timers(1/3/5).
- When they match, one of the following actions may occur on the associated CCPx pin:
 1. driven high
 2. driven low
 3. toggle output
 4. remains unchanged

Software Interrupt Mode

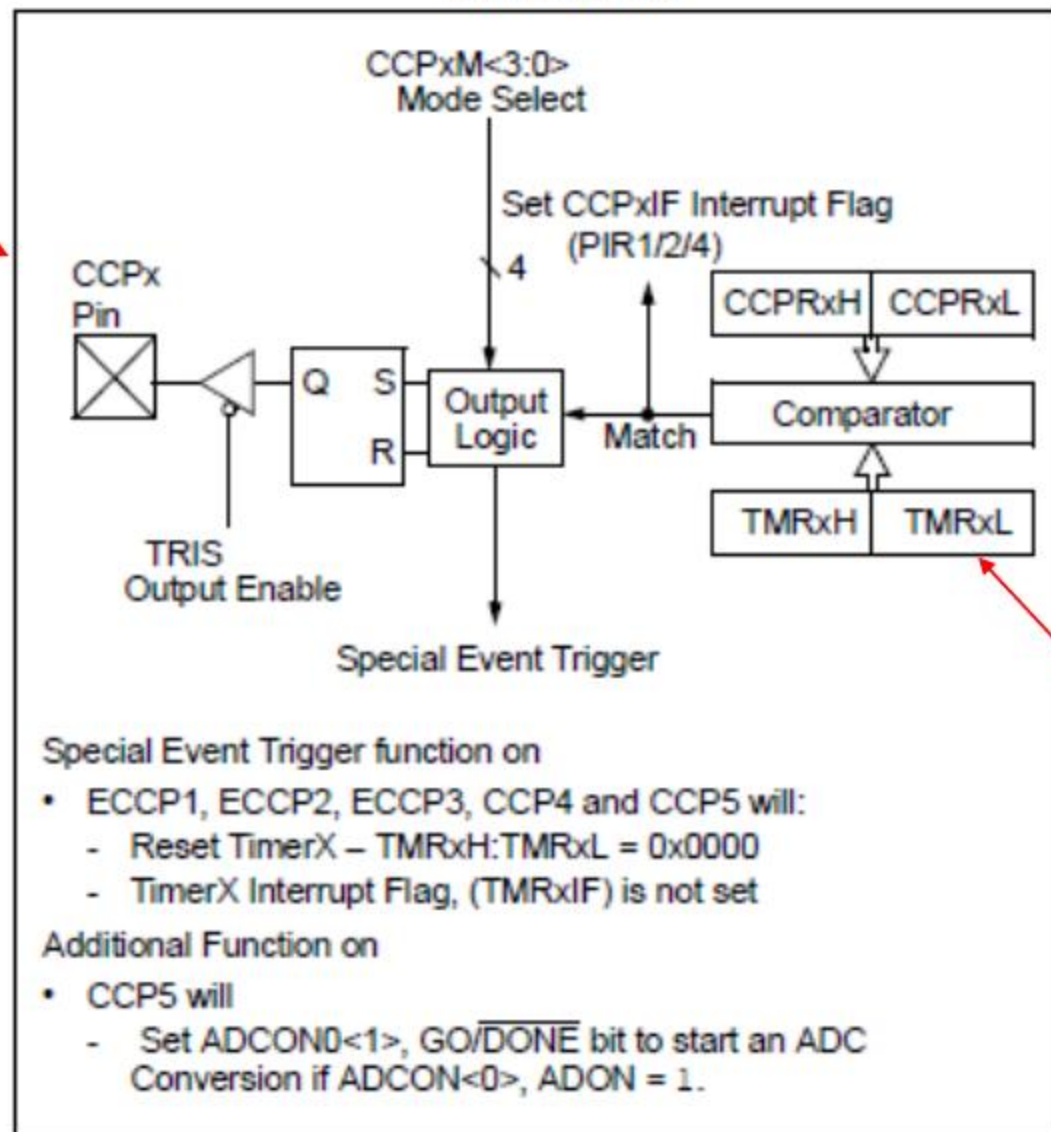

When Generate Software Interrupt mode is chosen (1010), the CCPx module does not assert control of the CCPx pin.

Special Event Trigger

The CCPx modules can also generate this event (mode 1011) to reset TMR1/3/5 depending on which timer is the base timer. When this mode is selected CCP5 will start an ADC conversion, if the ADC is enabled.

Compare Unit

FIGURE 14-2: COMPARE MODE OPERATION BLOCK DIAGRAM

CCPx Pin must be configured as an Output

TimerX must be active and configured (prescaler, CLK source) properly.

Example: use CCP Compare to Generate Sound

Example code:

For the circuit in Figure 8.22, write a program to generate a simple song assuming that $f_{OSC} = 4\text{MHz}$.

Solution:

Two tables are used by the program. 1) Table of numbers to be added to CCPR1 register to generate the waveform with the desired frequency. 2) Table of numbers that select the duration of each note. CCP1 module is used to generate the signal -compare mode toggle CCP1 pin on match-. TIMER0 is used for note duration.

```
#include <xc.h>
#define base 3125 // counter count to create 0.1 s delay
#define NOTES 38 // total notes in the song to be played

const unsigned int per_arr[38]={ C4,A4,G4,A4,F4,C4,C4,C5,

PWM function

Pulse Width Modulation (PWM) Function

Generates (automatically) a PWM signal

$$\text{Period} = T_{PWM}$$

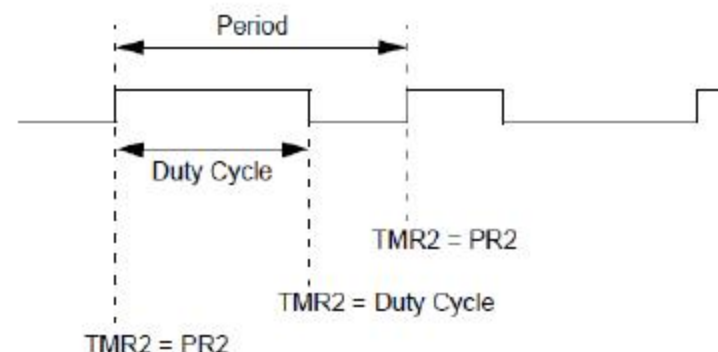

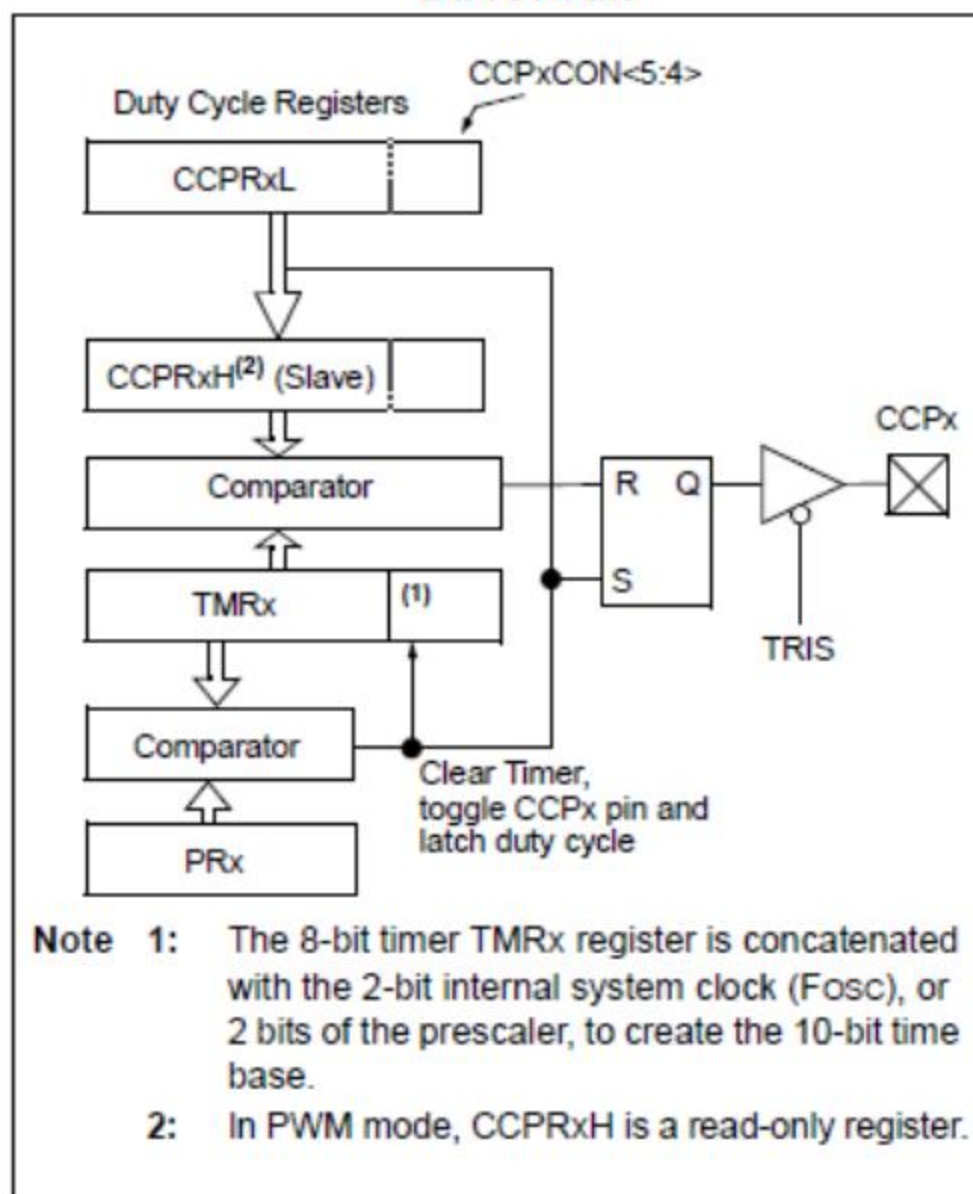

$$\text{Frequency, } F_{PWM} = 1 / T_{PWM}$$

$$\text{Duty Cycle} = (T_{ON} / T_{PWM}) \times 100$$

PWM Mode

FIGURE 14-4: SIMPLIFIED PWM BLOCK DIAGRAM

Period & Duty cycle

Pwm formulas:

EQUATION 14-1: PWM PERIOD

$$PWM\ Period = [(PRx) + 1] \cdot 4 \cdot TOSC \cdot (TMRx\ Prescale\ Value)$$

Note 1: $TOSC = 1/FOSC$

EQUATION 14-2: PULSE WIDTH

$$Pulse\ Width = (CCPRxL:CCPxCON<5:4>) \cdot TOSC \cdot (TMRx\ Prescale\ Value)$$

EQUATION 14-4: PWM RESOLUTION

$$Resolution = \frac{\log[4(PRx + 1)]}{\log(2)}\ bits$$

EQUATION 14-3: DUTY CYCLE RATIO

$$Duty\ Cycle\ Ratio = \frac{(CCPRxL:CCPxCON<5:4>)}{4(PRx + 1)}$$

TABLE 14-7: EXAMPLE PWM FREQUENCIES AND RESOLUTIONS ($FOSC = 32\ MHz$)

PWM Frequency	1.95 kHz	7.81 kHz	31.25 kHz	125 kHz	250 kHz	333.3 kHz
Timer Prescale (1, 4, 16)	16	4	1	1	1	1
PRx Value	0xFF	0xFF	0xFF	0x3F	0x1F	0x17
Maximum Resolution (bits)	10	10	10	8	7	6.6

TABLE 14-8: EXAMPLE PWM FREQUENCIES AND RESOLUTIONS ($FOSC = 20\ MHz$)

PWM Frequency	1.22 kHz	4.88 kHz	19.53 kHz	78.12 kHz	156.3 kHz	208.3 kHz
Timer Prescale (1, 4, 16)	16	4	1	1	1	1
PRx Value	0xFF	0xFF	0xFF	0x3F	0x1F	0x17
Maximum Resolution (bits)	10	10	10	8	7	6.6

TABLE 14-9: EXAMPLE PWM FREQUENCIES AND RESOLUTIONS ($FOSC = 8\ MHz$)

PWM Frequency	1.22 kHz	4.90 kHz	19.61 kHz	76.92 kHz	153.85 kHz	200.0 kHz
Timer Prescale (1, 4, 16)	16	4	1	1	1	1
PRx Value	0x65	0x65	0x65	0x19	0x0C	0x09
Maximum Resolution (bits)	8	8	8	6	5	5

Programming recipe.

1. Disable the CCPx pin output driver by setting the associated TRIS bit.
2. Select the 8-bit TimerX resource, (Timer2, Timer4 or Timer6) to be used for PWM generation by setting the CxTSEL<1:0> bits in the CCPTMRSx register.(1)
3. Load the PRx register for the selected TimerX with the PWM period value.
4. Configure the CCP module for the PWM mode by loading the CCPxCON register with appropriate values.
5. Load the CCPRxL register and the DCxB<1:0> bits of the CCPxCON register, with the PWM duty cycle value.
6. Configure and start the 8-bit TimerX resource:
 - Clear the TMRxIF interrupt flag bit of the PIR2 or PIR4 register.
 - Configure the TxCKPS bits of the TxCON register with the Timer prescale value.
 - Enable the Timer by setting the TMRxON bit of the TxCON register.
7. Enable PWM output pin:
 - Wait until the Timer overflows and the TMRxIF bit of the PIR2 or PIR4 register is set.
 - Enable the CCPx pin output driver by clearing the associated TRIS bit.

Light dimmer

DC Motor Control

- DC motor speed is regulated by controlling its average driving voltage. The higher the voltage, the faster the motor rotates.
- Changing motor direction can be achieved by reversing the driving voltage.
- Motor braking can be performed by reversing the driving voltage for certain length of time.
- Most PIC18 devices have PWM functions that can be used to drive DC motors.
- Many DC motors operate with 5 V supply.
- DC motors require large amount of current to operate. Special driver circuits are needed for this purpose.
- A simplified DC motor control circuit is shown in Figure 8.26.
